Howto enable DEBUG mode

I. Enable debug mode permanently

Edit the /etc/imscp/imscp.conf file and set the **DEBUG** parameter value to **1**.

II. Enable debug mode only for setup/update process

Execute the installer with the **–debug** command line option.

The logs in both cases should be in the folder /var/log/imscp/, since there are several modules, you will have to check various files. Most of the information on failed upgrades/installs would be in those files.

```
/var/log/imscp/imscp-setup.log
/var/log/imscp/imscp-rqst-mngr.log
```
