

# Howto enable DEBUG mode

## I. Enable debug mode permanently

Simply edit both the /etc/imscp/imscp.conf and the /etc/imscp/imscp.old.conf files and set the **DEBUG** parameter value to **1**.

## II. Enable debug mode only for setup/update process

### For versions already released:

Follow the procedure above and revert it back after.

### For master branch:

Just run the script with the debug command line option. (type perl <scriptname> -?) for more information about available command line options.

The logs in both cases should be in the folder /var/log/imscp/, since there are several modules, you will have to check various files. Most of the information on failed upgrades/installs would be in those files.

```
/var/log/imscp/imscp-setup.log  
/var/log/imscp/rqst-mngr.log
```
