

As explained in the [plugins](#)

The easiest way to enable a plugin for the system is to upload the package containing it.

- The easiest way is going to the releases tab in github and looking for the package releases [releases](#), that should work with the most stable packages
- You can download all the repository as a zip file in the repo main page [here](#)
  - Uncompress the zip file
  - Every folder will be a plugin in its own that has to be upload separately
  - tar -czf mailman.tgz Mailman/
- You can upload the whole unzipped directory into
  - /var/www/imsdp/gui/plugins/
