When connecting to the outside there's one can use proxy server to avoid part of the risk of being infected by using a list of trusted sites where you are connecting. On a server that has to be configured in serveral places, here are the places where you will have to configure the navigation proxy in order for it to work.

Apt-get

If you are on debian, you will have to configure the server to download its updates via proxy, you have to edit the file /etc/apt/apt.conf.d/proxy-guess and set it to:

```
Acquire::http::Proxy "http://user:password@proxy.example.com:3128/";
```

Curl

i-mscp relies on curl to download the information from the internet, so instead of integrating everything into i-mscp, it downloads some components (such as roundcube or phpmyadmin from their upstream projects. To configurate curl through a proxy, you will have to create a file /root/.curlrc with a content like this:

```
proxy = http://user:password@proxy.example.com:3128
```
